

Wear Engine — Data Permission Application and Use Instructions

Mobile app: **EasyLink** (package: easylink.yvak.inc), Android

Wearable app: **EasyLink Watch** (bundle: inc.yvak.easylink.watch), HarmonyOS Lightweight Smart Wearable (Lite Wearable, JS)

Developer: Andrei Vermel (Yvak Inc.). Contact: pilipbox@mail.ru

1. About the app

EasyLink is a companion app for EasyBridge LoRa mesh radios used for off-grid communication (hiking, mountain trips, emergencies, areas with no cellular coverage). The phone app connects to the radio over Bluetooth LE. The wearable capability forwards incoming text messages and SOS alerts to the user's Huawei watch and lets the watch send quick reply phrases and trigger an SOS broadcast while the phone stays in a pocket or backpack.

2. Requested permission and data use

Permission	Data obtained	Purpose of use	Storage & transfer
Basic device information (Device Ability)	Name and connection status of the paired watch; point-to-point (P2P) message channel between the phone app and the watch app.	1) Show the user which watch is linked. 2) Forward incoming off-grid text messages and SOS alerts from the phone app to the watch app. 3) Receive quick-reply phrases and SOS trigger commands from the watch app.	All data stays on the user's devices. Messages transit directly between the phone and the watch via Wear Engine. Nothing is uploaded to any server; the app has no cloud backend. No device identifiers are stored or shared with third parties.

3. Scope and frequency

The wearable link is OFF by default. Data is exchanged only after the user explicitly enables the "Huawei Watch" toggle in EasyLink settings and approves the Wear Engine authorization dialog. Messages are sent only on user actions (incoming radio message, SOS event, tap on the watch). The user can revoke access at any time by disabling the toggle or via the Huawei Health app.

4. Privacy

EasyLink does not collect analytics, does not create user accounts and does not transmit personal data to the Internet. The only network-less data path is: LoRa radio ↔ phone (BLE) ↔ watch (Wear Engine P2P).
